

Site Discovery Report

Prepared for <https://www.getglowstore.com/>

Generated March 11, 2026 04:53 UTC

Prepared by Optiminastic Advisory

Confidential

Executive Summary

Site infrastructure: HTTPS, robots.txt present, XML sitemap present. No JSON-LD structured data was found. Social sharing metadata: 5 of 6 Open Graph tags and 3 of 4 Twitter Card tags present. Content analysis: 1,401 words, 0 citation patterns, 0 statistical references, and 4 attributed quotes identified. Trust analysis: 0 authoritative domain links, 3 trust page(s), and 4 external domain(s) identified. AI extractability: 12 quotable sentences, 0 definition patterns, and 0 dependency phrase(s) found. No llms.txt file was found.

Engagement Snapshot

Sections	Analyses	Observations
7	22	83

Section Coverage

Section	Analyses	Observations
Site Foundation	9	15
Indexability & Performance	2	6
Graph & Discovery	2	5
Node Readability & Structured Data	3	17
Authority & Trust Signals	3	15
LLM Extraction & AI Readiness	2	11
Content Quality Analysis	1	14

Methodology

This report was generated through automated static analysis of the target URL. The analysis engine crawled the page and its associated resources (robots.txt, sitemap.xml, llms.txt), then performed 22 independent analyses across 7 domains: Site Foundation, Indexability & Performance, Graph & Discovery, Node Readability, Authority & Trust, LLM Extraction, and Content Quality. Each analysis

examines specific technical and content signals, extracts relevant data, and reports observations. No subjective assessments were made — all observations are based on the presence, absence, or measured value of specific signals in the HTML source and associated files.

Site Foundation

This section examines the fundamental technical infrastructure that determines how crawlers — both traditional search engines and AI systems — can access, understand, and navigate the site.

Robots.txt Correctness

Analysis of the robots.txt file, which controls how search engine and AI crawlers access the site. We examined whether the file exists, its directives, sitemap references, and AI bot policies.

- A robots.txt file was found at the root of the site.
- The robots.txt contains a blanket Disallow: / directive that blocks all crawlers from accessing site content.
- A Sitemap directive was found in robots.txt, pointing crawlers to the XML sitemap.
- No restrictions on AI-specific crawlers (GPTBot, ClaudeBot, PerplexityBot, etc.) were found.

Evidence	Detail
blocked_bots	

XML Sitemap

Examination of the XML sitemap at /sitemap.xml, which helps crawlers discover and index all pages. We checked for valid XML structure, URL entries, and specialized sitemap types.

- An XML sitemap was located at /sitemap.xml.
- The sitemap contains valid XML with URL entries.

Evidence	Detail
----------	--------

has_urls	true
----------	------

Image Sitemap

Analysis of image sitemap entries within the XML sitemap, which help search engines discover and index image content.

- No image sitemap entries were found.

Video Sitemap

Analysis of video sitemap entries within the XML sitemap, which help search engines discover and index video content.

- No video sitemap entries were found.

News Sitemap

Examination of news sitemap entries, which are used by Google News and other news aggregators to discover timely content.

- Site does not appear to be news-oriented.

HTTPS

Verification of HTTPS encryption, which is a fundamental security and trust signal for both users and search engines.

- The site is served over HTTPS with a valid TLS connection.

Canonical Tags

Analysis of canonical tags, which tell search engines which version of a page is the authoritative one, preventing duplicate content issues.

- A <link rel="canonical"> tag was found on the page.
- The canonical tag is self-referencing, pointing to the current URL.
- A single canonical tag is present with no conflicts.

Crawl Trap Prevention

Detection of crawl trap patterns — URL structures that can cause infinite crawling loops, such as session IDs, calendar patterns, or excessive query parameters.

- Session identifiers were found embedded in URLs, which can create crawl traps.

Evidence	Detail
trap_issues	2

Robots Meta Tags

Examination of robots meta tags and X-Robots-Tag headers, which provide page-level instructions to crawlers about indexing and link-following behavior.

- No robots meta tag is present — crawlers are free to index and follow links.

Indexability & Performance

This section analyzes how effectively the page can be indexed by search engines, including rendering strategy, mobile compatibility, and performance indicators.

Core Web Vitals & Load Time

Analysis of performance-related indicators discoverable from the HTML source, including viewport configuration for mobile compatibility and resource hints (preconnect/preload) for faster loading.

- The page loaded in 0.7s, indicating fast server response.
- A viewport meta tag was found, indicating mobile-responsive configuration.
- Resource hints (preconnect/preload directives) were found, indicating performance optimization.

Evidence	Detail
load_time_ms	687.4605999328196

JS Rendering Visibility

Assessment of the page's rendering strategy — whether content is available in the raw HTML (server-side rendered) or requires JavaScript execution (client-side rendered).

- A `<noscript>` fallback is provided for environments without JavaScript support.
- Main content is present in the raw HTML source (server-side rendered).
- 1401_words of text content was found in the raw HTML, indicating server-side rendering.

Evidence	Detail
word_count	1401

Graph & Discovery

This section examines how the page connects to the broader site structure and how it makes itself discoverable to AI systems through internal linking and machine-readable descriptions.

Internal Linking Structure

Analysis of the internal linking structure, including link count, anchor text diversity, navigation patterns, and contextual links within content paragraphs.

- 119 internal links were found on the page.
- A substantial internal link network was found (10 or more internal links).
- Moderate anchor text diversity was observed across internal links.
- 5 contextual links (links embedded within paragraph text) were found.

Evidence	Detail
link_count	119

llms.txt Presence & Quality

Examination of the llms.txt file at /.well-known/llms.txt, a machine-readable description of the site specifically designed for Large Language Models.

- No llms.txt file was found — no machine-readable site description is available for LLMs.

Node Readability & Structured Data

This section analyzes the page's structured data markup, semantic HTML, and social sharing metadata — the machine-readable layer that enables search engines and platforms to understand and present the content.

JSON-LD Structured Data

Comprehensive analysis of JSON-LD structured data markup. We extracted all schema types, evaluated property completeness against the schema.org specification (19 recognized types with required and recommended properties), and checked for date metadata freshness.

- No JSON-LD structured data was found on the page.

OG & Twitter Metadata

Discovery of Open Graph and Twitter Card meta tags, which control how the page appears when shared on social media platforms, messaging apps, and other surfaces that generate link previews.

- The og:title meta tag was found.
- The og:description meta tag was found.
- The og:image meta tag is absent — link previews on social platforms will lack an image.
- The og:url meta tag was found.
- The og:type meta tag was found.
- The og:site_name meta tag was found.
- The twitter:card meta tag was found.

- The twitter:title meta tag was found.

- The twitter:image meta tag is absent.

- The twitter:description meta tag was found.

- The og:description is 198 characters long (optimal range: 50-160 characters).

twitter_tags_found	3
twitter_tags_missing	twitter:image

Semantic HTML & DOM

Analysis of the page's semantic HTML structure, including heading hierarchy (H1-H6), heading count, and use of semantic elements.

- The following semantic HTML tags were found: main, section, header, footer.
- 2 H1 headings were found on the page (convention recommends exactly one).
- The heading hierarchy contains gaps (e.g., H2 directly followed by H4).
- A total of 18 heading tags were found across the page.
- 23 list elements (ul/ol) were found on the page.

Evidence	Detail
semantic_tags	main, section, header, footer

Authority & Trust Signals

This section examines the signals that establish the page's credibility — author attribution, organizational identity, professional credentials, links to authoritative sources, and transparency indicators.

Entity & Brand Identity

Discovery of brand and entity signals, including Organization schema markup, brand mentions in page titles, contact information, social profile links, and Wikipedia references.

- The detected brand name is: Get Glow Store.
- No Organization schema markup was found.
- Social profile links were found for: facebook.com, instagram.com.
- The brand name appears in the page title or H1 heading.
- Contact information (email or phone link) was found on the page.

Evidence	Detail
brand	Get Glow Store
social	facebook.com, instagram.com

Author E-E-A-T

Comprehensive E-E-A-T (Experience, Expertise, Authoritativeness, Trustworthiness) analysis. We examined author attribution, Person schema markup, professional credentials, links to authoritative domains (.gov, .edu, major publications), trust pages (about, contact, privacy, terms), publication dates, external source diversity, and transparency signals (editorial policies, disclosures).

- An author byline or attribution was found on the page.

- No links to author or about pages were found.
- No Person schema markup was found.
- Professional credentials or titles were mentioned in the page content.
- No links to authoritative or trust domains (.gov, .edu, major publications) were found.
- The following trust pages were found among the site's links: contact, privacy, terms.
- No publication date was found on the page.
- External links point to 4 distinct domains, indicating source diversity.
- The following organizational information signals were found: our story.

Schema for Expertise

Analysis of domain-specific expertise signals in structured data, including specialized schema types (Medical, Legal, Financial), speakable markup for voice assistants, and credential properties.

- No schema markup of any kind was found.

LLM Extraction & AI Readiness

This section analyzes how effectively AI systems and Large Language Models can extract, cite, and use the page's content. It examines content structures that facilitate machine comprehension.

AI-Extractable Content Blocks

Examination of FAQ-style content structures that are directly extractable by AI systems — including FAQPage JSON-LD schema, details/summary accordion blocks, and question-style headings.

- 1 question-style headings (ending with '?') were found.
- Some Q&A blocks contain answers, but coverage is limited.

Evidence	Detail
faq_schema_items	0
question_headings	1

AI Visibility

Static analysis of how extractable and citable the page's content is for Large Language Models. We examined answer-first formatting, citation patterns, paragraph self-containedness, key takeaway blocks, definition patterns, sentence quotability, and content chunking via descriptive headings.

- The content does not open with a direct answer.
- No structured citation patterns were found that language models could use for source attribution.
- All paragraphs are self-contained — no dependency language ('as mentioned above', 'see below') was detected.
- No key takeaway or summary blocks were found.

- No definition patterns ('X is defined as', 'X refers to') were found.
- 12 short, factual declarative sentences (10-30 words) were found that are suitable for direct quoting by AI systems.
- 12 H2/H3 headings were found, providing content chunking for navigability.
- Of these, 10 are descriptive (non-generic) headings that convey topical meaning.
- 2 headings use generic text (e.g., 'Introduction', 'Overview') that does not convey specific topic information.

Content Quality Analysis

This section provides a deep analysis of content quality indicators — the signals that determine whether content is well-researched, authoritative, readable, and substantive.

Content Quality

Deep analysis of content quality signals based on information retrieval research. We examined citation and source references, statistical data points, expert quotes, authoritative vs. hedging language, readability metrics (Flesch-Kincaid), technical terminology, vocabulary diversity (Type-Token Ratio), paragraph structure, transition words, answer-first formatting, and keyword repetition.

- No citation or source reference patterns were found in the content.
- No statistical data points were found in the content.
- 4 attributed quotes or blockquote elements were found.
- 4 HTML blockquote elements were found.
- 1 hedging or uncertainty markers were detected (e.g., 'I think', 'maybe', 'possibly').
- The Flesch-Kincaid grade level is 14.0 (optimal range: 6-12 for general audiences).
- The Flesch reading ease score is 33.1 (higher is easier to read; 60+ is considered accessible).
- 10 technical terms were identified, including acronyms, defined terms, and compound technical phrases.
- The vocabulary Type-Token Ratio is 0.502 (a measure of lexical diversity; higher values indicate more varied word choice).
- The total content word count is 1401.

- The average paragraph length is 12.1 words (optimal range: 20-80 words for readability).
- 23 list elements (ul/ol) were found on the page.
- The content does not open with a direct answer.
- The most frequently repeated two-word phrase is: "get glow (11x, 1.1%)".
